

Case: Curfew Extension
Plaintiff: Your Mom
Defendant: You

Your friend has just won two concert tickets from a radio station contest. The concert is next Friday. Because this is a promotional concert, you are anticipating on getting home a little after curfew. Your mom agrees to let you go, but only if you can prove to her that you spend more time on your homework than you do anything else after school.

She has given you a breakdown of your activities after school. While examining her category totals, you notice that not only is the gathered information incorrect but she added the totals up wrong.

You want to confront her with her mistakes but before you do you must fix the problems on the spreadsheet.

Your task is to:

1. fix the Excel spreadsheet that breaks down every activity you do after school every day
2. enter the total amount of minutes you spend on each activity each day
3. learn a way to automatically add up the total minutes of each activity for each day
4. create a formula that finds the average of how many minutes you spend on each activity per school week
5. create formulas that convert your total minutes into hours and any left over minutes should be rounded to the nearest hour

Be creative in your format styles.
